

VSP440 – Visual Speech Mapping

Feature Overview

Interacoustics[®]

leading diagnostic solutions

Promotes sales

Visual reinforcement for an explanation is important in the learning process. Forming realistic expectations from the hearing aid is crucial to its use. An informed client is more likely to become a satisfied client and therefore the road to fewer returns.

Encourages binaural fitting

VSP440 uses the Speech Intelligibility Index as a measure of binaural aid benefit. The simple percentage comparison between monaural and binaural results usually reflects the client's experience and will often be enough to convince them of the need for two aids.

Involving relatives

Relatives are often the motivation for seeking assistance. VSP440 demonstrates the effects of hearing loss and the features that are relevant in alleviating the problems.

Demonstrating advanced features

The VSP graphs demonstrate compression, power output limitation and other advanced features. They also illustrate how a linear hearing aid reaches the client's uncomfortable loudness level in comparison with non-linear hearing aids.
